Contents

Current conditions

Maps of observed precipitation conditions, individual graphics by basin are produced from MERGE/GPM data generated by INPE/CPTEC, considering the period from de 2000 a 2025. ***Between January 27 to February 25, 2026, below-average rainfall caused precipitation deficits in the main course of the Amazon River in Brazilian territory, the hydrographic basins of the Abacaxis, Aripuanã, Beni, Branco, Coari, Guaporé, Iriri, Ji-Paraná, Juruá, Juruena, Jutaí, Madeira, Mamoré, basins on the left bank of the Amazon River in the northeast and northwest of the state of Pará, Negro, Purus, Tapajós, Tefé, Teles Pires, Xingu, and the main course of the Solimões River; rainfall above climatology recorded on the main course of the Amazon River in Peruvian territory, basins of the Içá, Marañon, Napo, and Ucayali rivers; rainfall close to normal recorded on the hydrographic basins of the Curuá Una, Japurá, Javari rivers and basins on the left bank of the Amazon River in the northeast of the state of Amazonas. The multimodel indicates below-average rainfall for the coming weeks on the main course of the Amazon River in Brazilian territory, the Branco, Curuá Una, Içá, Iriri, Japurá, Jutaí, Madeira, the left bank basins of the Amazon River in the northeast of the state of Amazonas and in the northeast and northwest of the state of Pará, Negro, and the main course of the Solimões River; rainfall above climatology is forecast for the Beni, Juruena, Mamoré, and Teles Pires river basins.***

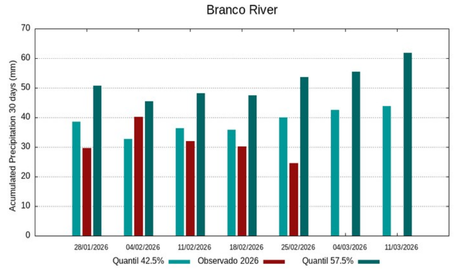
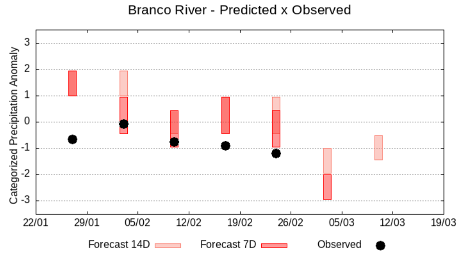
Individual analysis by river basin

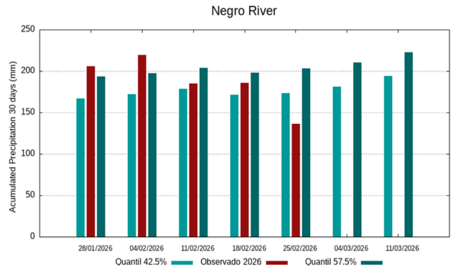
Branco River Basin

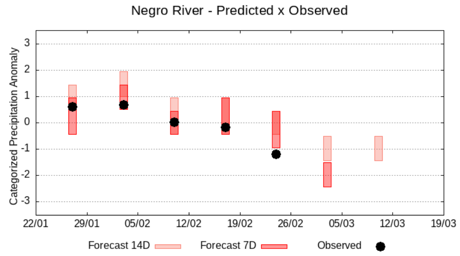




The climatology of the period under analysis indicates rainfall with records varying between ***40 and 54 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 25 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.3,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***very dry behavior or a tending to be extremely dry.***

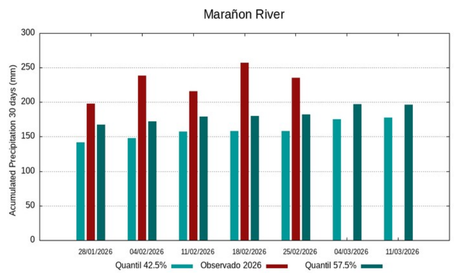
Negro River Basin

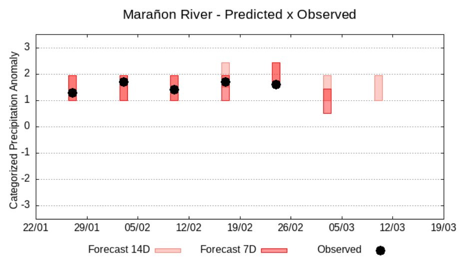




The climatology of the period under analysis indicates rainfall with records varying between ***173 e 203 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 136 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.3,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***very dry behavior or a tending to be very dry.***

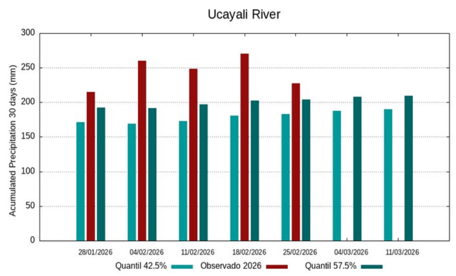
Marañon River Basin

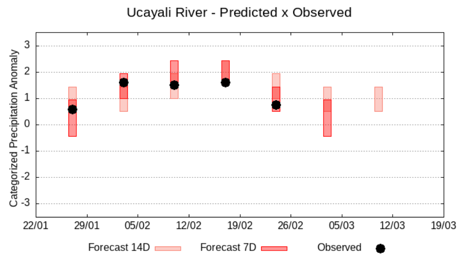




The climatology of the period under analysis indicates rainfall with records varying between ***158 e 182 mm*** s being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 235 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***1.6,*** classifies the basin as ***tendency to very rainy condition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***rainy behavior or a tending to be rainy.***

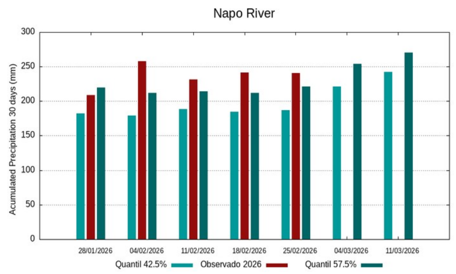
Ucayali River Basin

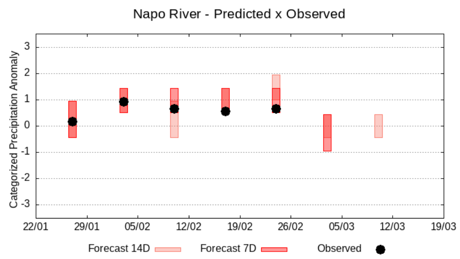




The climatology of the period under analysis indicates rainfall with records varying between ***183 e 204 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 227 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***0.7,*** classifies the basin as ***tendency to rainy condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be rainy.***

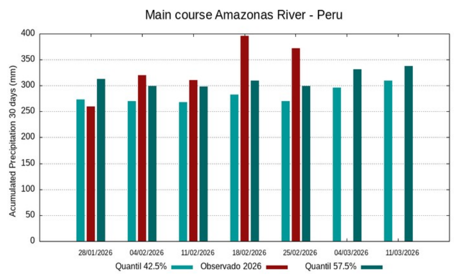
Napo River Basin

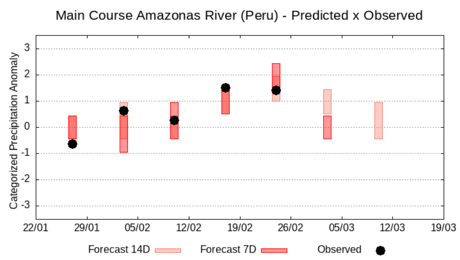




The climatology of the period under analysis indicates rainfall with records varying between ***187 e 221 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 241 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***0.7,*** classifies the basin as ***tendency to rainy condition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

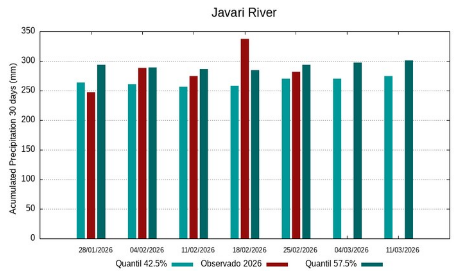
The main course of the Amazon River (Peru)

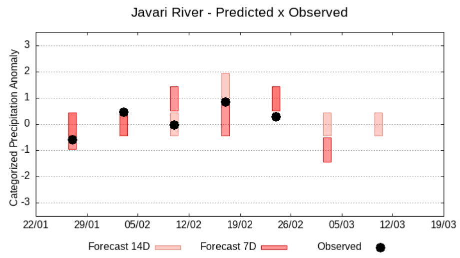




The climatology of the period under analysis indicates rainfall with records varying between ***270 e 299 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 372 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***1.6,*** classifies the basin as ***tendency to very rainy condition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality.***

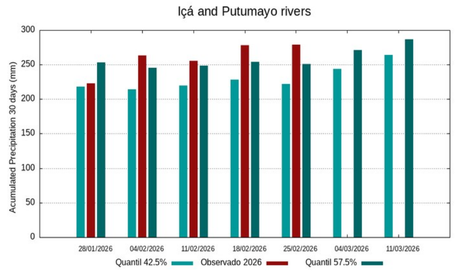
Javari River Basin

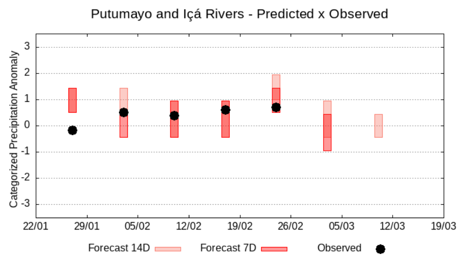




The climatology of the period under analysis indicates rainfall with records varying between ***270 e 294 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 282 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***0.1,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

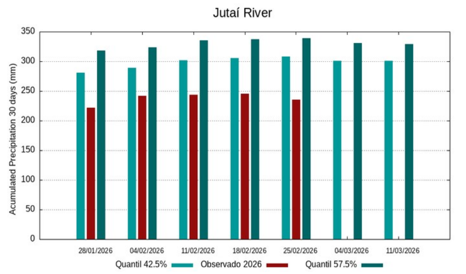
Putumayo and Içá Rivers Basins

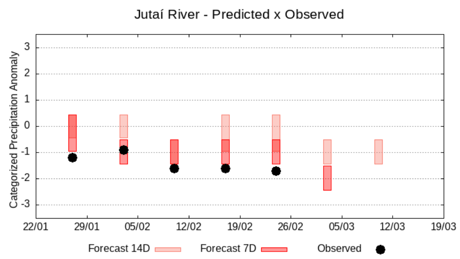




The climatology of the period under analysis indicates rainfall with records varying between ***222 e 251 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 279 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***0.9,*** classifies the basin as ***tendency to rainy condition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

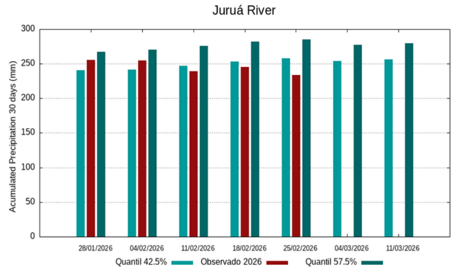
Jutaí River Basin

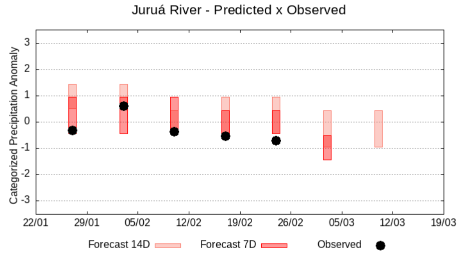




The climatology of the period under analysis indicates rainfall with records varying between ***308 e 339 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 235 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.7,*** classifies the basin as ***tendency to very dry contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***very dry behavior or a tending to be very dry.***

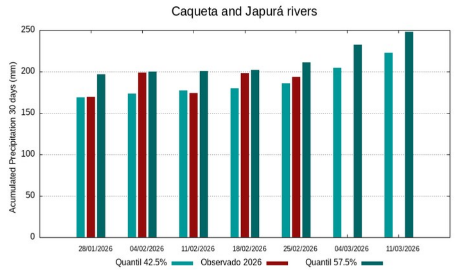
Juruá River Basin

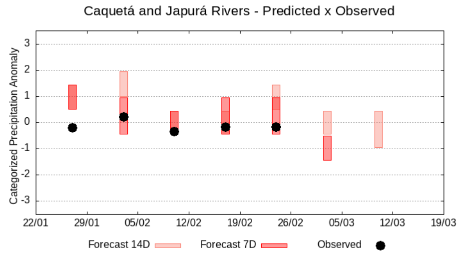




The climatology of the period under analysis indicates rainfall with records varying between ***258 e 285 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 234 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.7,*** classifies the basin as ***tendency to dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

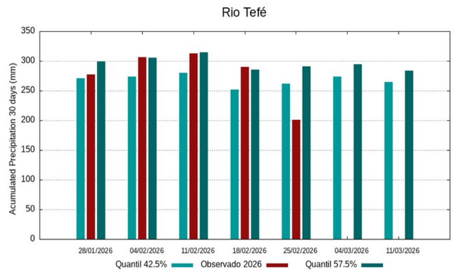
Caquetá and Japurá Rivers Basins

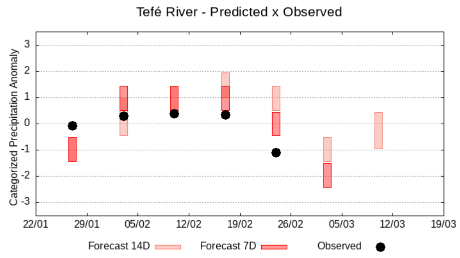




The climatology of the period under analysis indicates rainfall with records varying between ***185 e 211 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 194 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.1,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

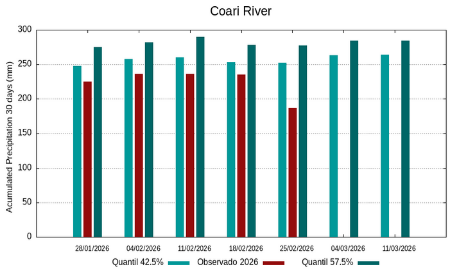
Tefé River Basin

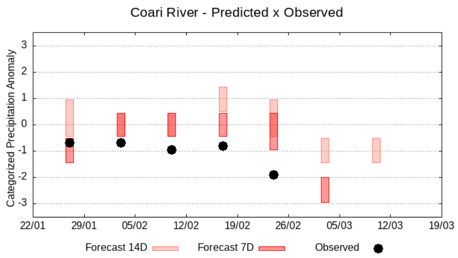




The climatology of the period under analysis indicates rainfall with records varying between ***262 e 291 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 201 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.8,*** classifies the basin as ***tendency to very dry contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***very dry behavior or a tending to be very dry.***

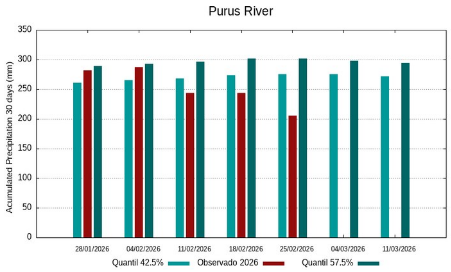
Coari River Basin

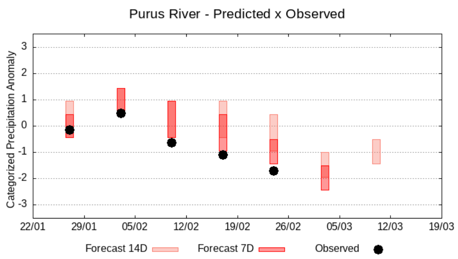




The climatology of the period under analysis indicates rainfall with records varying between ***253 e 277 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 187 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-2.2,*** classifies the basin as ***very dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***very dry behavior or a tending to be extremely dry.***

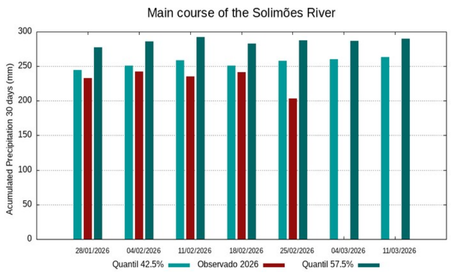
Purus River Basin

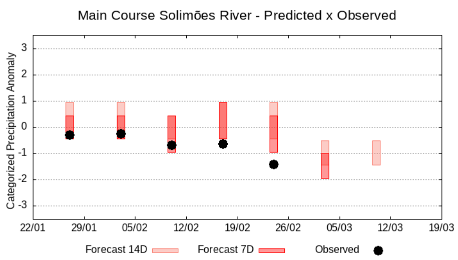




The climatology of the period under analysis indicates rainfall with records varying between ***275 e 302 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 205 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-2.0,*** classifies the basin as ***very dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***very dry behavior or a tending to be very dry.***

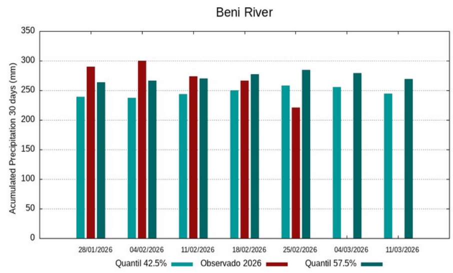
The main course of the Solimões River

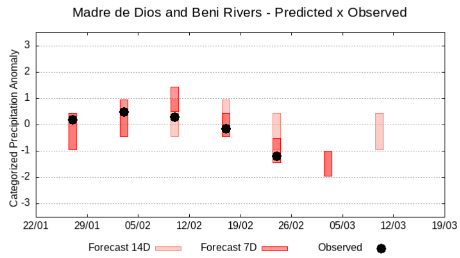




The climatology of the period under analysis indicates rainfall with records varying between ***258 e 287 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 203 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.4,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be very dry.***

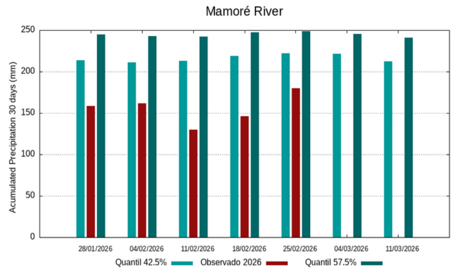
Madre de Dios and Beni Rivers Basins

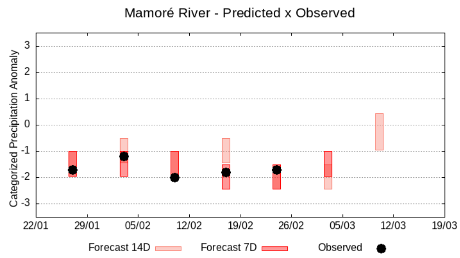




The climatology of the period under analysis indicates rainfall with records varying between ***258 e 284 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 221 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.3,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be very dry.***

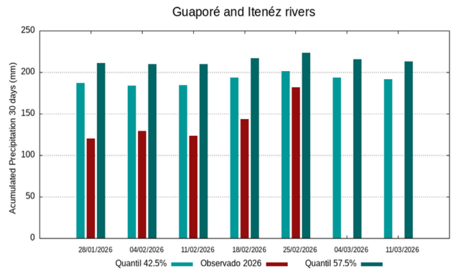
Mamoré River Basin

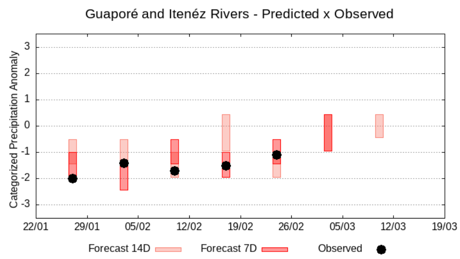




The climatology of the period under analysis indicates rainfall with records varying between ***222 e 249 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 180 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.3,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be very dry.***

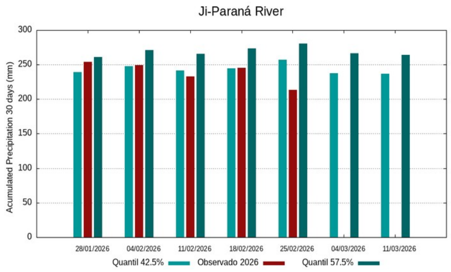
Guaporé and Intenéz Rivers Basins

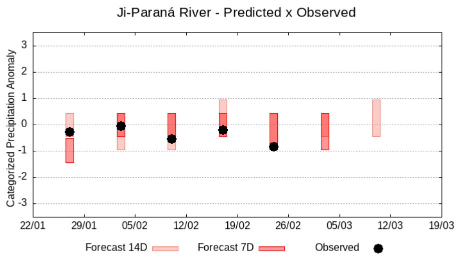




The climatology of the period under analysis indicates rainfall with records varying between ***201 e 223 mm*** sendo being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 182 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.7,*** classifies the basin as ***tendency to dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

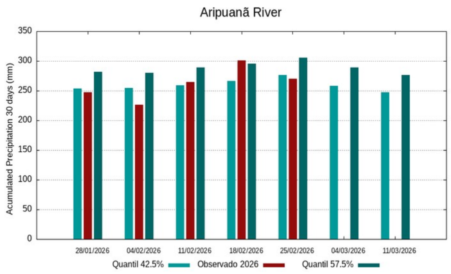
Ji-Paraná River Basin

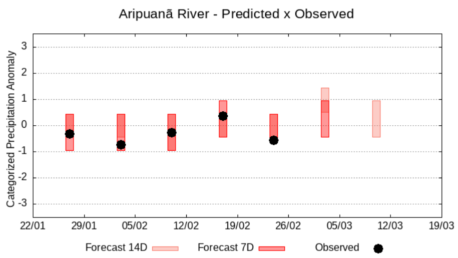




The climatology of the period under analysis indicates rainfall with records varying between ***257 e 281 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 213 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.1,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

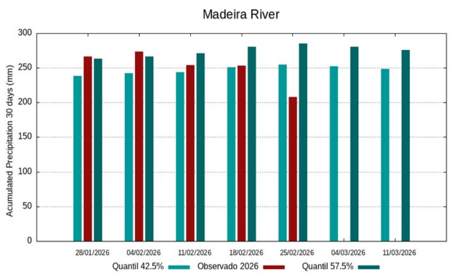
Aripuanã River Basin

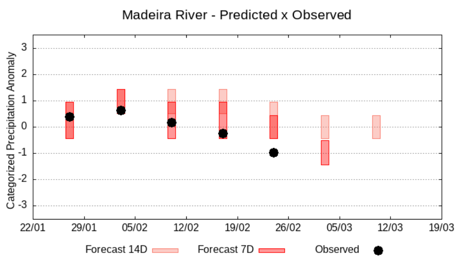




The climatology of the period under analysis indicates rainfall with records varying between ***276 e 306 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 270 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.6,*** classifies the basin as ***tendency to dry condition.*** In the coming weeks, climate behavior indicates a ***decrease*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be rainy.***

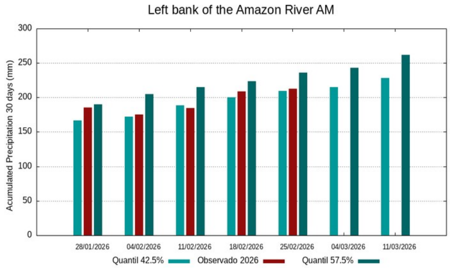
Madeira River Basin

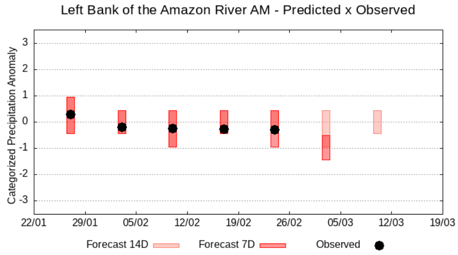




The climatology of the period under analysis indicates rainfall with records varying between ***255 e 285 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 208 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.3,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

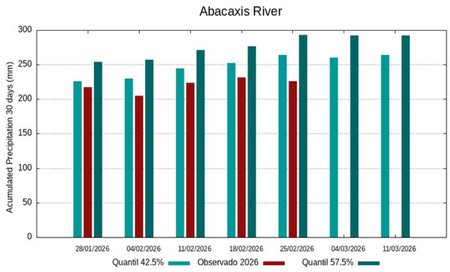
Basins on the left bank of the Amazon River (Amazonas State)

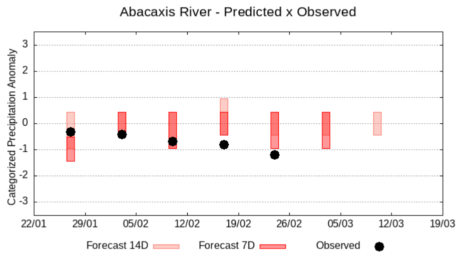




The climatology of the period under analysis indicates rainfall with records varying between ***210 e 236 mm*** sendo being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 213 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.4,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

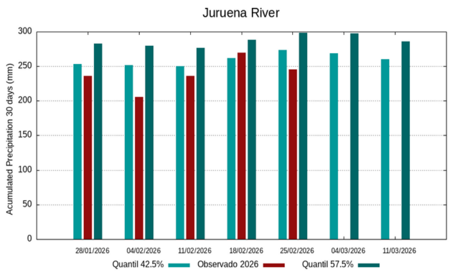
Abacaxis River Basin

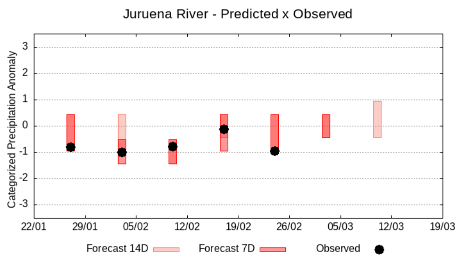




The climatology of the period under analysis indicates rainfall with records varying between ***264 e 293 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 226 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.1,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

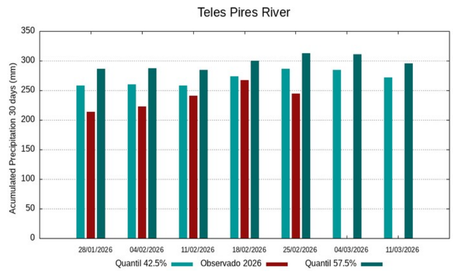
Juruena River Basin

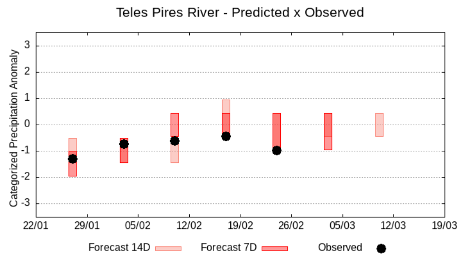




The climatology of the period under analysis indicates rainfall with records varying between ***273 e 298 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 246 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.9,*** classifies the basin as ***tendency to dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality.***

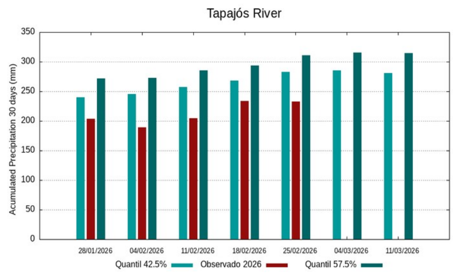
Teles Pires River Basin

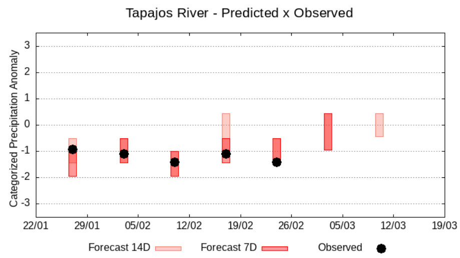




The climatology of the period under analysis indicates rainfall with records varying between ***287 e 313 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 245 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.0,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

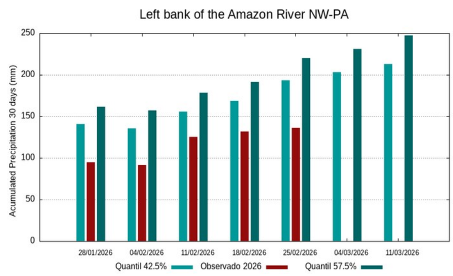
Tapajós River Basin

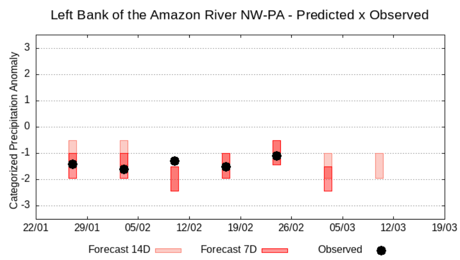




The climatology of the period under analysis indicates rainfall with records varying between ***283 e 311 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 233 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.3,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

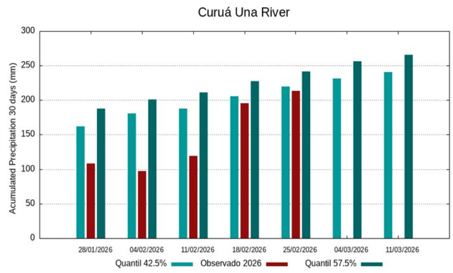
Basins on the left bank of the Amazon River (northwest of the Pará State)

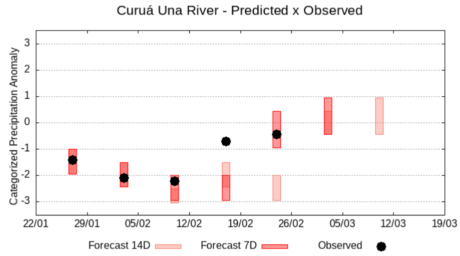




The climatology of the period under analysis indicates rainfall with records varying between ***193 e 220 mm*** sendo being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 136 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.8,*** classifies the basin as ***tendency to very dry contition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***very dry behavior or a tending to be very dry.***

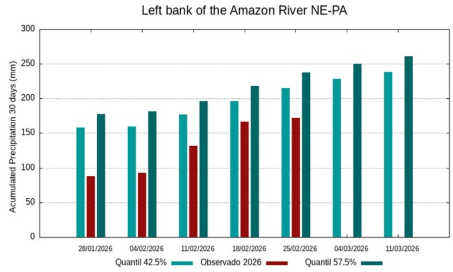
Curuá Una River Basin

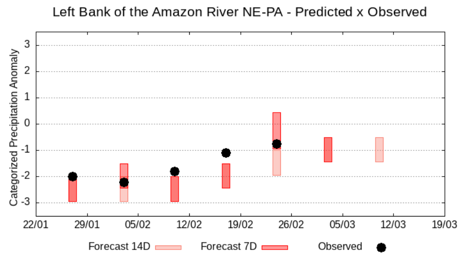




The climatology of the period under analysis indicates rainfall with records varying between ***220 e 241 mm*** sendo being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 214 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.4,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be rainy.***

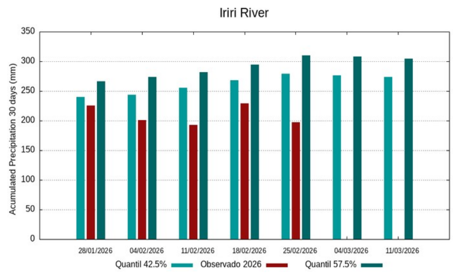
Basins on the left bank of the Amazon River (north-estern of the Pará State)

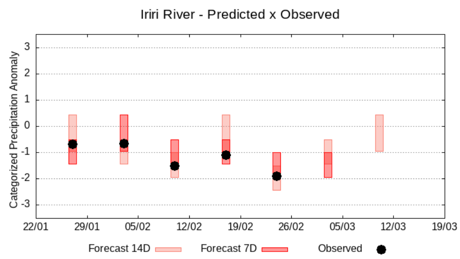




The climatology of the period under analysis indicates rainfall with records varying between ***215 e 237 mm*** sendo being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 172 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.4,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

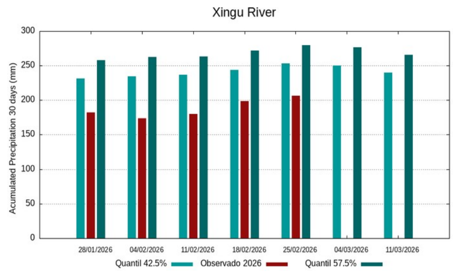
Iriri River Basin

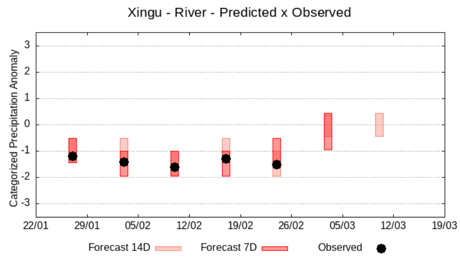




The climatology of the period under analysis indicates rainfall with records varying between ***279 e 310 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 198 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.8,*** classifies the basin as ***tendency to very dry contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be very dry.***

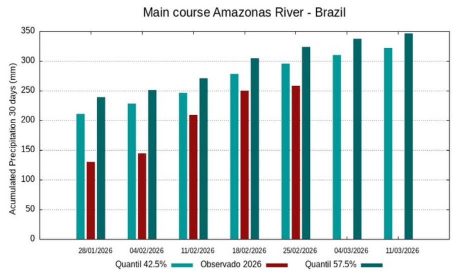
Xingu River Basin

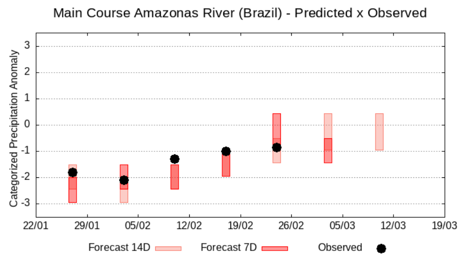




The climatology of the period under analysis indicates rainfall with records varying between ***253 e 280 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 206 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.3,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

The main course of the Amazon River (Brazil)





The climatology of the period under analysis indicates rainfall with records varying between ***296 e 324 mm*** sendo being considered normal (reference quantiles 42.5% and 57.5%). On ***February 25, 2026, 258 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.2,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

A multi-model sub-seasonal forecast CPTEC/INPE-FUNCEME produced on 02/24/2026 for the next 7 and 14 days.

The calibrated sub-seasonal multi-model forecast CPTEC/INPE-FUNCEME is generated through scientific cooperation between CPTEC/INPE and FUNCEME, and comes from a set of 4 global models (a Brazilian model, BAM-1.2/CPTEC, and three US models, CFSv2/NCEP, GEFSv12/NCEP and ESRL/NOAA, the latter three from the SubX project). Brazilian model, BAM-1.2/CPTEC, and three US models, CFSv2/NCEP, GEFSv12/NCEP, and ESRL/NOAA, the latter three from the SubX project). The forecast precipitation anomalies are determined in relation to the climatological period from 1999 to 2016. The outputs for the 7 and 14-day forecast intervals are shown below, detailing the forecast behavior of the basins of interest.

The figure above shows the prognosis for the 14-day interval between 02/25/2026 e 03/10/2026, forecast of a predominance of precipitation deficit (orange) in the north of the monitored region, over the main course of the Amazon River in Brazilian territory, the basins of the Branco, Curuá Una, Içá, Iriri, Japurá, Jutaí, Madeira, the left bank basins of the Amazon River in the northeast of the state of Amazonas and in the northeast and northwest of the state of Pará, Negro, Xingu, and the main course of the Solimões River. Forecast of positive precipitation anomalies (blue) over the Beni, Juruena, Mamoré, Marañon, and Teles Pires river basins. Forecast of rainfall close to climatology (white) over the other monitored basins.

Reference Values for 30-day accumulated precipitation on the date of analysis.

Table 1 shows the average accumulated precipitation values (mm of rain) per basin, based on precipitation estimates using satellite images, a product called MERGE/GPM, made available by the National Institute for Space Research, for the period 2000 - 2022, taking into account the geographical limits of the Amazon basin's watersheds. To this end, the quantile technique was used, as it is a suitable and accurate tool for categorizing precipitation and anomalies of discrete variables. The following thresholds were adopted: 5%, 12.5%, 20%, 27.5%, 35%, 42.5%, 57.5%, 65%, 72.5%, 80%, 87.5%, and 95% in order to stratify the technique and allow for a more detailed categorization of the conditions in each monitored basin.

25/02/2026	Quantiles for categorizing precipitation anomalies											
	5.0%	12.5%	20.0%	27.5%	35.0%	42.5%	57.5%	65.0%	72.5%	80.0%	87.5%	95.0%
Abacaxis	120	165	195	222	245	264	293	312	333	360	393	441
Amazonas (BR)	172	211	237	258	277	296	324	344	364	386	417	469
Amazonas (PE)	128	187	214	236	254	270	299	321	348	379	410	468
Aripuanã	140	180	210	235	256	276	306	326	349	377	412	465

Table 1. Accumulated precipitation quantiles (mm) in 30 days (*27 de January a 25 de February)*,

Climatology of the period (2000 - 2025) MERGE/GPM – INPE/CPTEC.

Categorizing rainfall anomalies

Using the values in the table above, it is possible to categorize the rainfall observed in the current year in relation to the values observed in the previous records since the beginning of the available series, so the observed values below the 5% quantile characterize the basin in an extremely dry condition, between 5 and 12.5% in an extremely dry tendency condition, between 12.5 and 20% very dry condition, between 20 and 27.5% very dry tendency, between 27. 5 and 35% dry condition, between 35 and 42.5 dry tendency condition, values between 42.5 and 57.5 define normal condition, values between 57.5 and 65% rainy tendency condition, between 65 and 72.5% rainy condition, between 72.5 and 80% very rainy tendency, between 80 and 87.5 very rainy condition, between 87.5 and 95% indicate extremely rainy tendency and finally values above 95% define the basin in extremely rainy condition, as per the legend below.

QUANTILE	5.0%	12.5%	20.0%	27.5%	35.0%	42.5%		57.5%	65.0%	72.5%	80.0%	87.5%	95.0%
INDEX	-3.0	-2.5	-2.0	-1.5	-1.0	-0.5	0.0	0.5	1.0	1.5	2.0	2.5	3.0
CATEGORY	EXTREMELY DRY	EXTREMELY DRY TENDENCY	VERY DRY	VERY DRY TENDENCY	DRY	DRY TENDENCY	NORMAL	RAINY TENDENCY	RAINY	VERY RAINY TENDENCY	VERY RAINY	EXTREMELY RAINY TENDENCY	EXTRMELY RAINY

The tables below show (Table 2A) the average precipitation observed (mm) in each basin, taking as reference the precipitation estimates by satellite using the MERGE technique, available at http://ftp.cptec.inpe.br/modelos/tempo/MERGE/GPM/DAILY/ accumulated in 30 days on the indicated dates, the average values of the categorized anomalies (Table 2B) were estimated based on the anomaly value of each pixel in the monitored watershed area, calculated according to the methodology described in the previous item, on the same dates of precipitation monitoring, the color scale of the anomalies follows the legend described.
