Contents

Current conditions

Maps of observed precipitation conditions, individual graphics by basin are produced from MERGE/GPM data generated by INPE/CPTEC, considering the period from de 2000 a 2025. ***Between January 20 to February 18, 2026, below-average rainfall caused precipitation deficits along the main course of the Amazon River in Brazilian territory, the watersheds of the Abacaxis, Branco, Coari, Curuá Una, Guaporé, Iriri, Jutaí, Mamoré, the left bank basins of the Amazon River in the northeast and northwest of the state of Pará, Purus, Tapajós, Xingu, and the main course of the Solimões River; rainfall above climatological norms was recorded on the main course of the Amazon River in Peruvian territory and in the basins of the Içá, Javari, Marañon, Napo, and Ucayali rivers; rainfall close to normal recorded over the Aripuanã, Beni, Japurá, Ji-Paraná, Juruá, Juruena, and Madeira river basins, basins on the left bank of the Amazon River in the northeast of the state of Amazonas, and the Negro, Tefé, and Teles Pires rivers. The multimodel indicates below-normal rainfall for the coming weeks on the main course of the Amazon River in Brazilian territory, the Abacaxis, Aripuanã, Beni, Branco, Coari, Curuá Una, Guaporé, Iriri, Ji-Paraná, Juruena, Madeira, Mamoré, basins on the left bank of the Amazon River in the northeast and northwest of the state of Pará, Purus, Tapajós, Ucayali, and Xingu; rainfall above climatology is forecast for the Japurá and Negro river basins in the first week.***

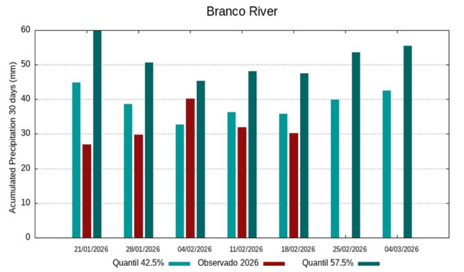
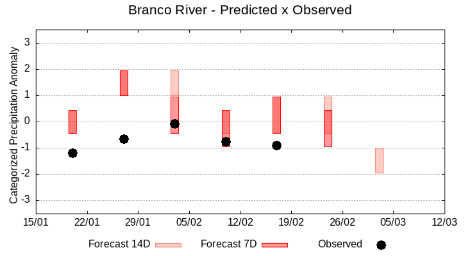
Individual analysis by river basin

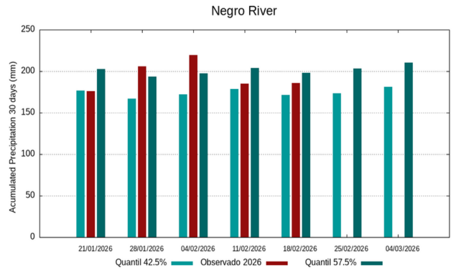
Branco River Basin

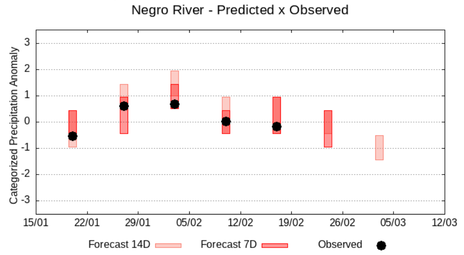




The climatology of the period under analysis indicates rainfall with records varying between ***36 and 48 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 30 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.9,*** classifies the basin as ***tendency to dry condition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

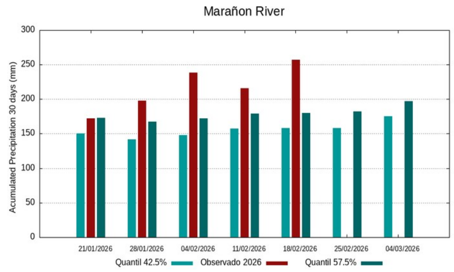
Negro River Basin

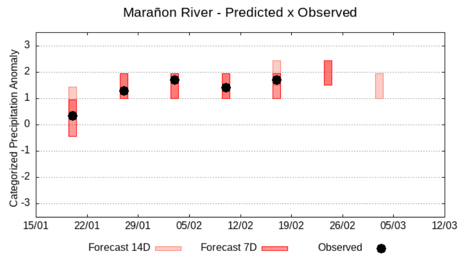




The climatology of the period under analysis indicates rainfall with records varying between ***171 e 198 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 186 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***0.0,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

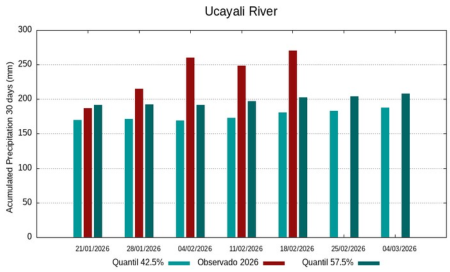
Marañon River Basin

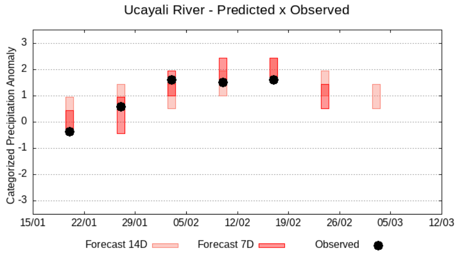




The climatology of the period under analysis indicates rainfall with records varying between ***158 e 180 mm*** s being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 257 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***1.9,*** classifies the basin as ***tendency to very rainy condition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***very rainy behavior or a tending to be very rainy.***

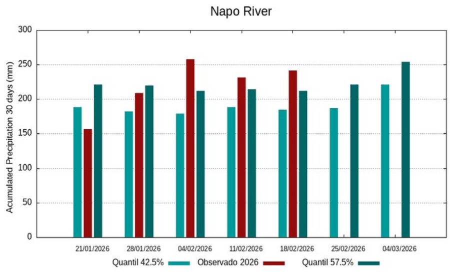
Ucayali River Basin

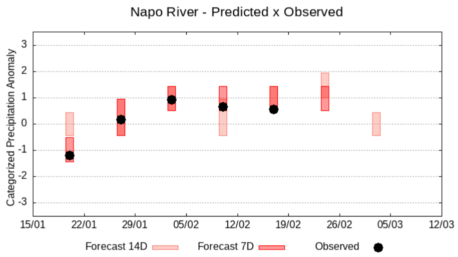




The climatology of the period under analysis indicates rainfall with records varying between ***181 e 203 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 271 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***1.7,*** classifies the basin as ***tendency to very rainy condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***rainy behavior or a tending to be rainy.***

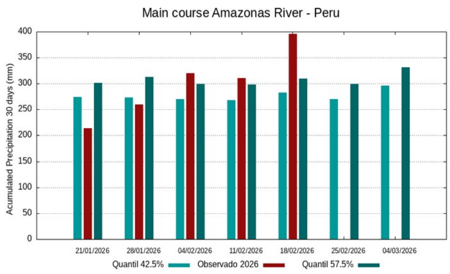
Napo River Basin

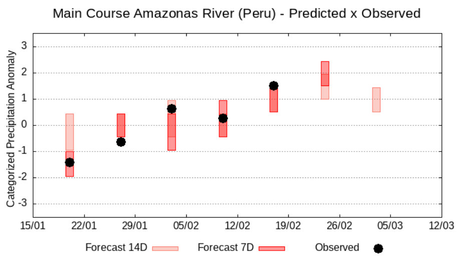




The climatology of the period under analysis indicates rainfall with records varying between ***185 e 212 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 241 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***0.8,*** classifies the basin as ***tendency to rainy condition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***rainy behavior or a tending to be rainy.***

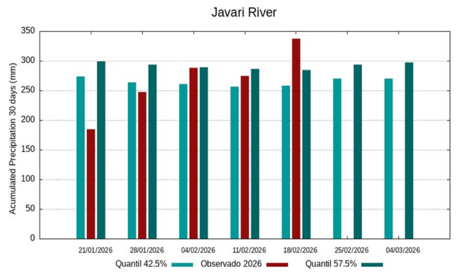
The main course of the Amazon River (Peru)

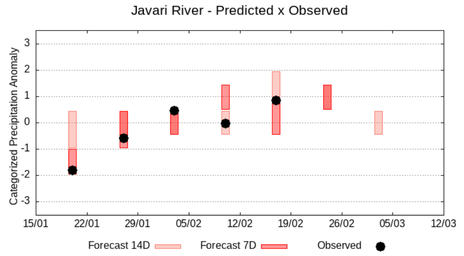




The climatology of the period under analysis indicates rainfall with records varying between ***282 e 310 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 396 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***1.9,*** classifies the basin as ***tendency to very rainy condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***very rainy behavior or a tending to be very rainy.***

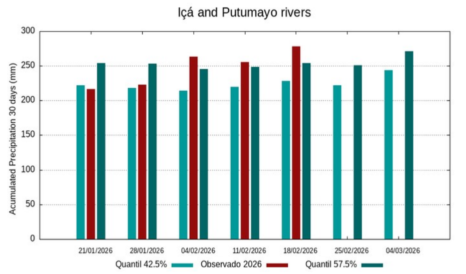
Javari River Basin

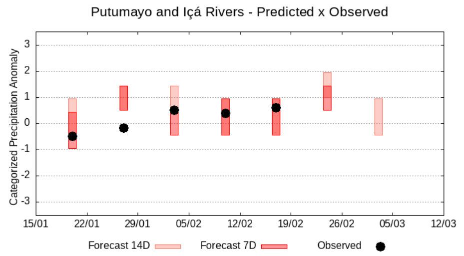




The climatology of the period under analysis indicates rainfall with records varying between ***258 e 284 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 338 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***1.1,*** classifies the basin as ***rainy condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***rainy behavior or a tending to be rainy.***

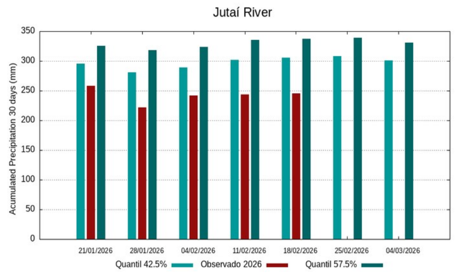
Putumayo and Içá Rivers Basins

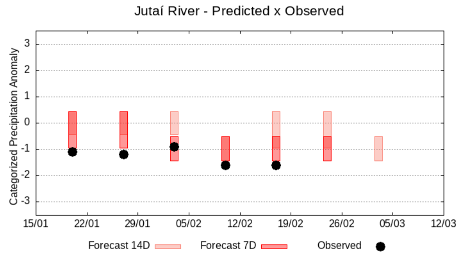




The climatology of the period under analysis indicates rainfall with records varying between ***228 e 254 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 278 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***0.8,*** classifies the basin as ***tendency to rainy condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***rainy behavior or a tending to be rainy.***

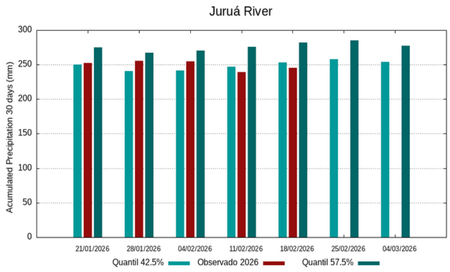
Jutaí River Basin

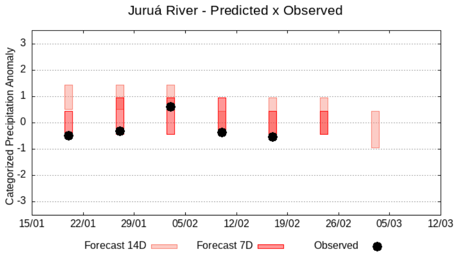




The climatology of the period under analysis indicates rainfall with records varying between ***305 e 337 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 245 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.5,*** classifies the basin as ***tendency to very dry contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

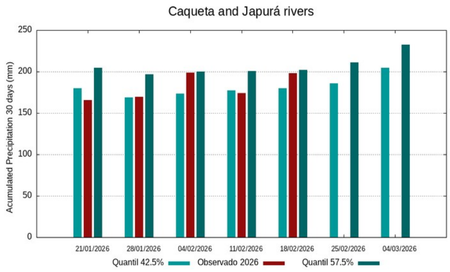
Juruá River Basin

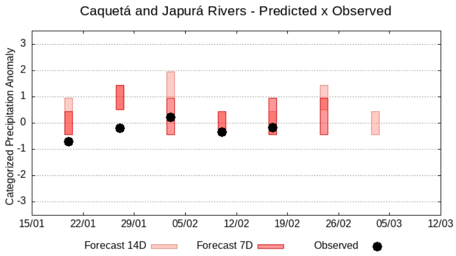




The climatology of the period under analysis indicates rainfall with records varying between ***254 e 282 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 246 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.4,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality.***

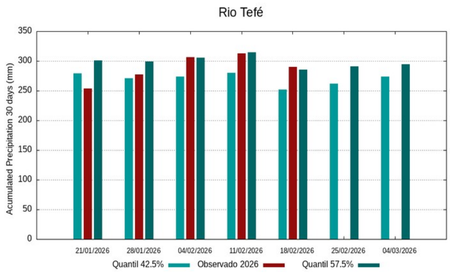
Caquetá and Japurá Rivers Basins

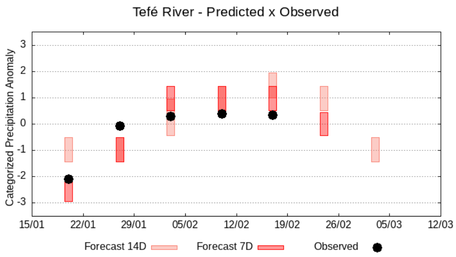




The climatology of the period under analysis indicates rainfall with records varying between ***180 e 202 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 198 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***0.1,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be rainy.***

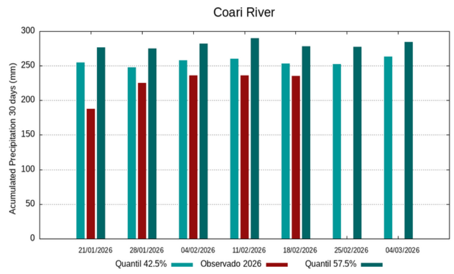
Tefé River Basin

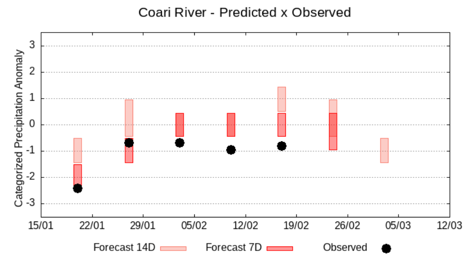




The climatology of the period under analysis indicates rainfall with records varying between ***252 e 286 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 290 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***0.4,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality.***

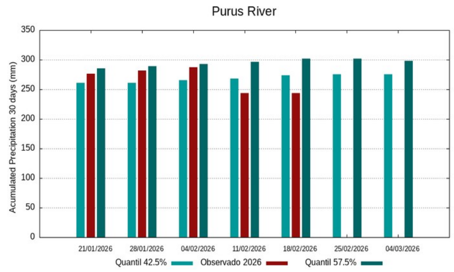
Coari River Basin

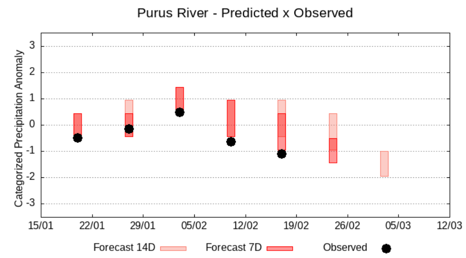




The climatology of the period under analysis indicates rainfall with records varying between ***253 e 278 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 236 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.7,*** classifies the basin as ***tendency to dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

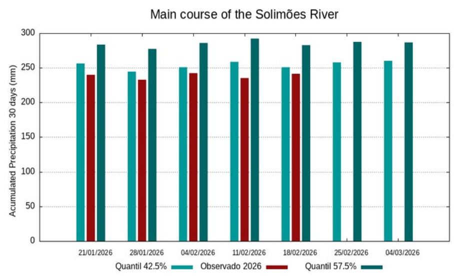
Purus River Basin

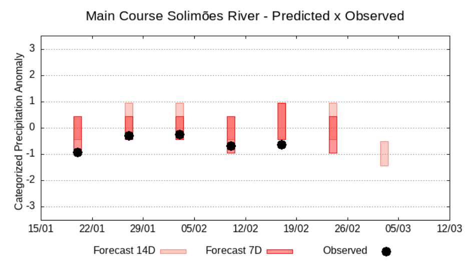




The climatology of the period under analysis indicates rainfall with records varying between ***274 e 302 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 244 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.0,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

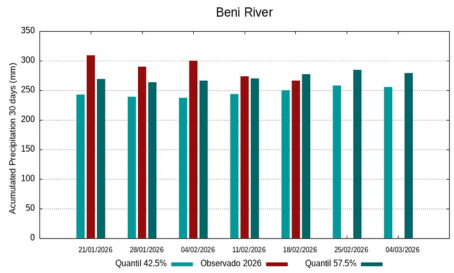
The main course of the Solimões River

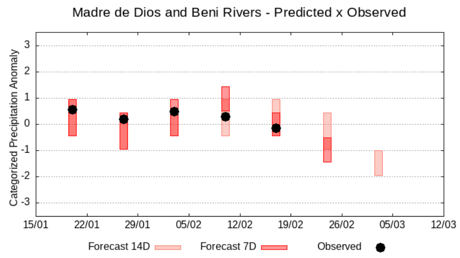




The climatology of the period under analysis indicates rainfall with records varying between ***251 e 283 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 242 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.6,*** classifies the basin as ***tendency to dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

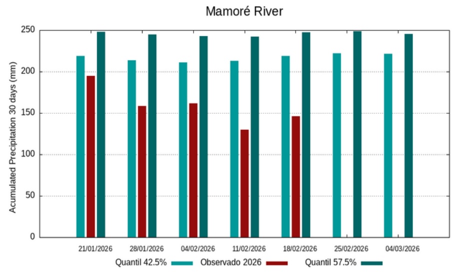
Madre de Dios and Beni Rivers Basins

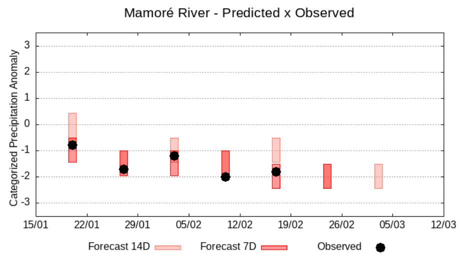




The climatology of the period under analysis indicates rainfall with records varying between ***250 e 277 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 267 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.1,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

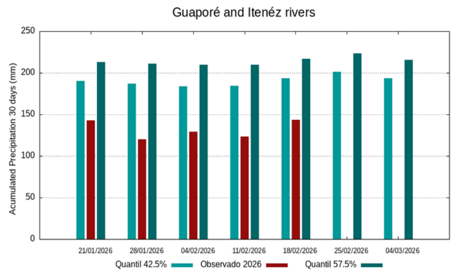
Mamoré River Basin

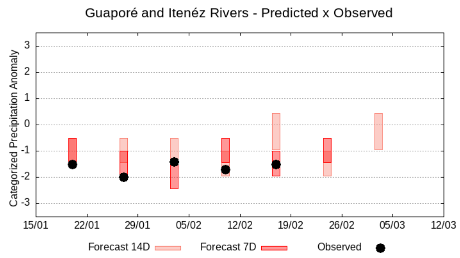




The climatology of the period under analysis indicates rainfall with records varying between ***219 e 248 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 146 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-2.0,*** classifies the basin as ***very dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***very dry behavior or a tending to be very dry.***

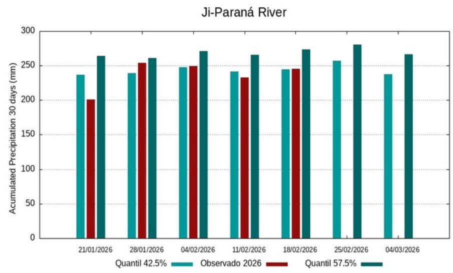
Guaporé and Intenéz Rivers Basins

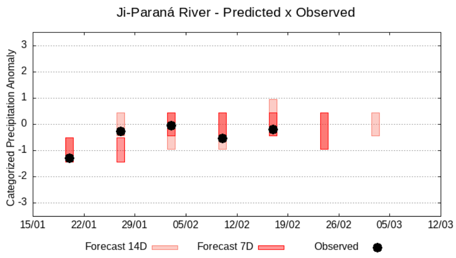




The climatology of the period under analysis indicates rainfall with records varying between ***193 e 217 mm*** sendo being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 144 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.5,*** classifies the basin as ***tendency to very dry contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

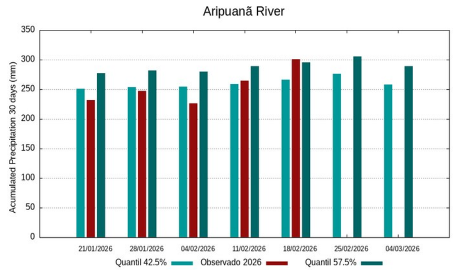
Ji-Paraná River Basin

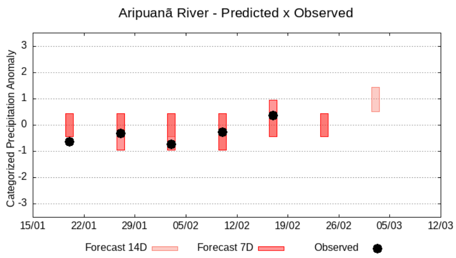




The climatology of the period under analysis indicates rainfall with records varying between ***244 e 273 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 245 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.2,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

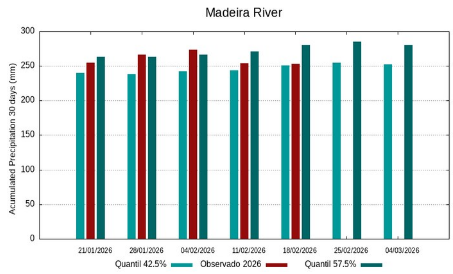
Aripuanã River Basin

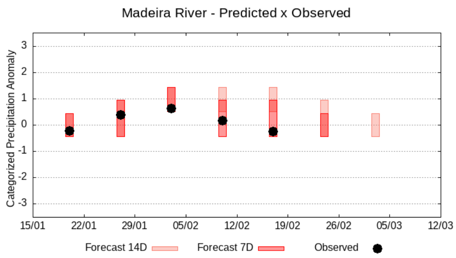




The climatology of the period under analysis indicates rainfall with records varying between ***266 e 296 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 301 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***0.3,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality.***

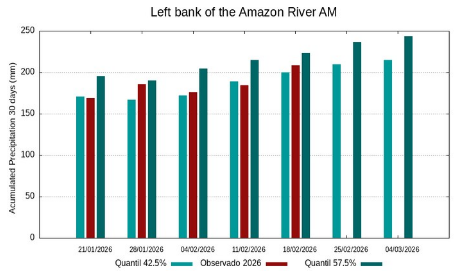
Madeira River Basin

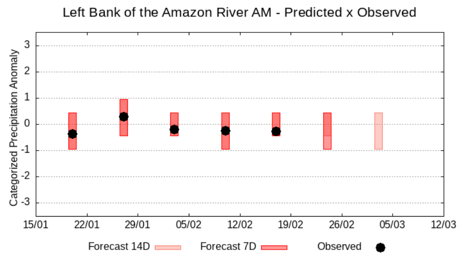




The climatology of the period under analysis indicates rainfall with records varying between ***251 e 280 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 253 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.2,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality.***

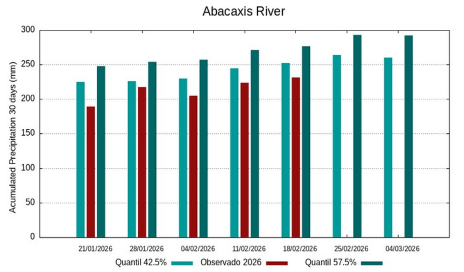
Basins on the left bank of the Amazon River (Amazonas State)

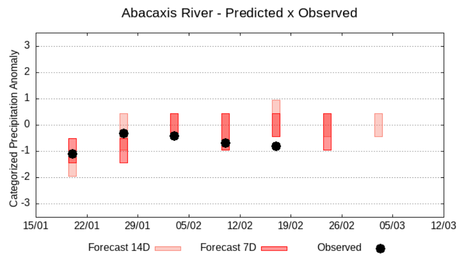




The climatology of the period under analysis indicates rainfall with records varying between ***200 e 224 mm*** sendo being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 209 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.1,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

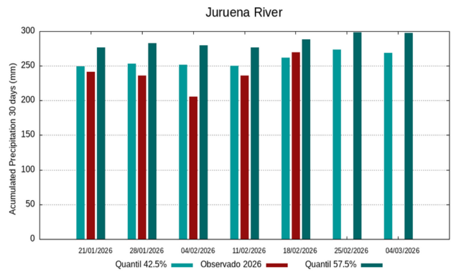
Abacaxis River Basin

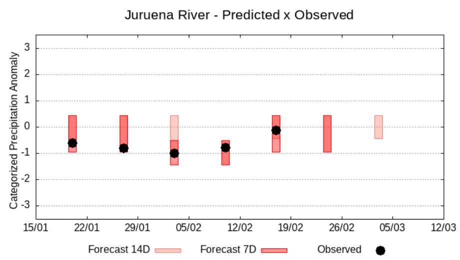




The climatology of the period under analysis indicates rainfall with records varying between ***253 e 277 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 232 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.8,*** classifies the basin as ***tendency to dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

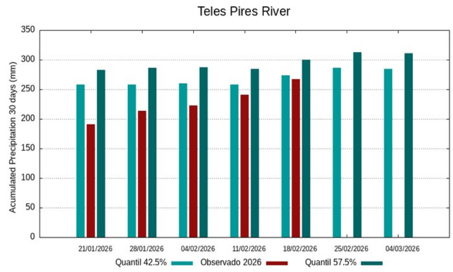
Juruena River Basin

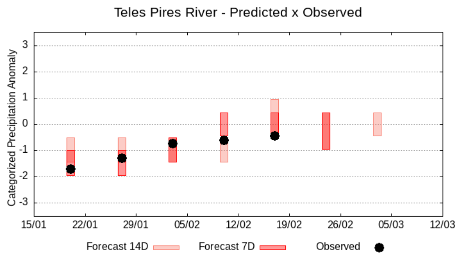




The climatology of the period under analysis indicates rainfall with records varying between ***262 e 289 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 270 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.1,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

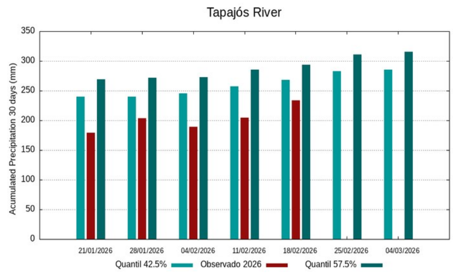
Teles Pires River Basin

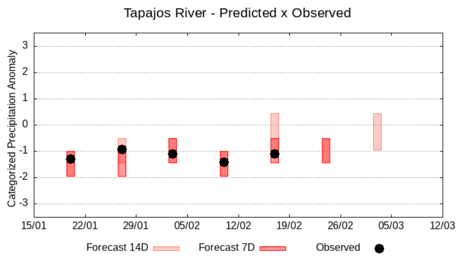




The climatology of the period under analysis indicates rainfall with records varying between ***273 e 300 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 267 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.4,*** classifies the basin as ***normal contition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

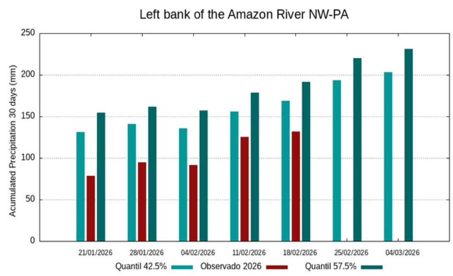
Tapajós River Basin

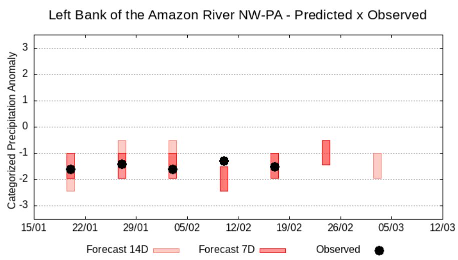




The climatology of the period under analysis indicates rainfall with records varying between ***268 e 294 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 233 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.1,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

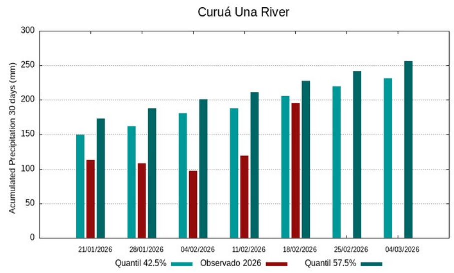
Basins on the left bank of the Amazon River (northwest of the Pará State)

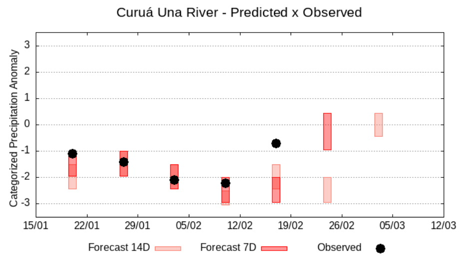




The climatology of the period under analysis indicates rainfall with records varying between ***169 e 191 mm*** sendo being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 132 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.5,*** classifies the basin as ***tendency to very dry contition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

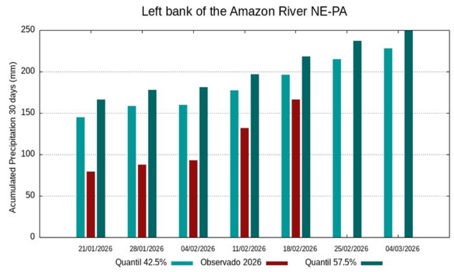
Curuá Una River Basin

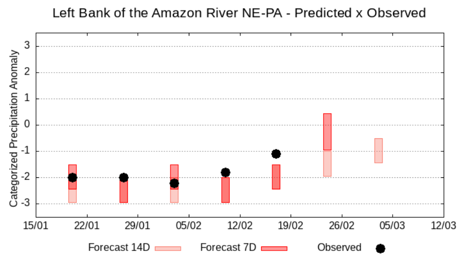




The climatology of the period under analysis indicates rainfall with records varying between ***206 e 227 mm*** sendo being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 195 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-0.6,*** classifies the basin as ***tendency to dry condition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

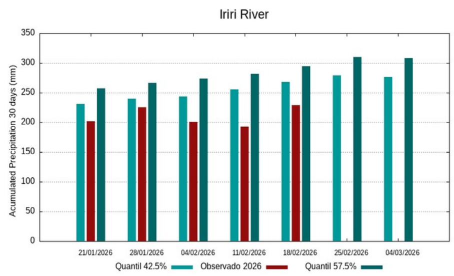
Basins on the left bank of the Amazon River (north-estern of the Pará State)

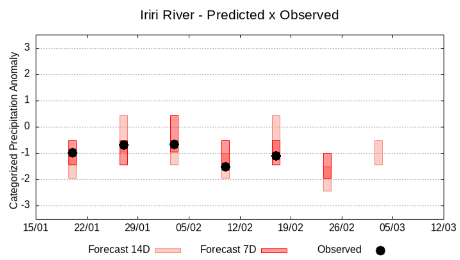




The climatology of the period under analysis indicates rainfall with records varying between ***196 e 218 mm*** sendo being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 167 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.2,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

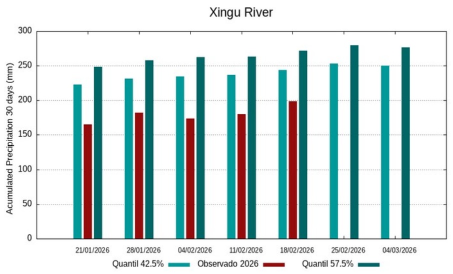
Iriri River Basin

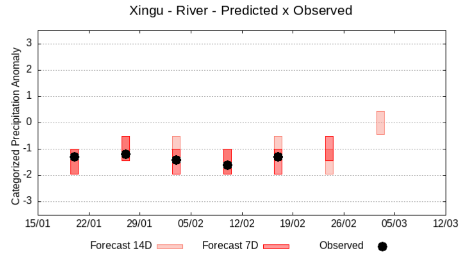




The climatology of the period under analysis indicates rainfall with records varying between ***269 e 295 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 229 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.1,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be very dry.***

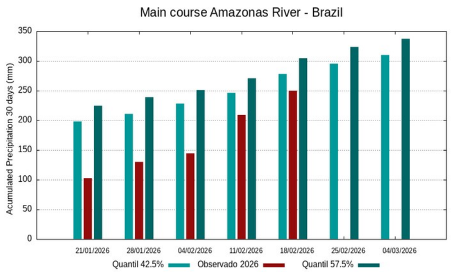
Xingu River Basin

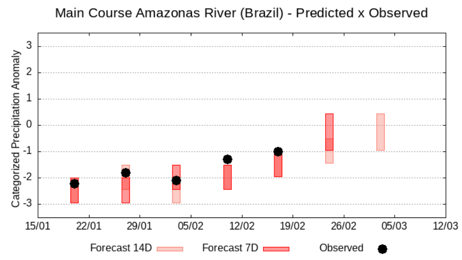




The climatology of the period under analysis indicates rainfall with records varying between ***244 e 272 mm*** being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 199 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.3,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***maintenance*** in rainfall volumes, the sub-seasonal forecast model suggests ***dry behavior or a tending to be dry.***

The main course of the Amazon River (Brazil)

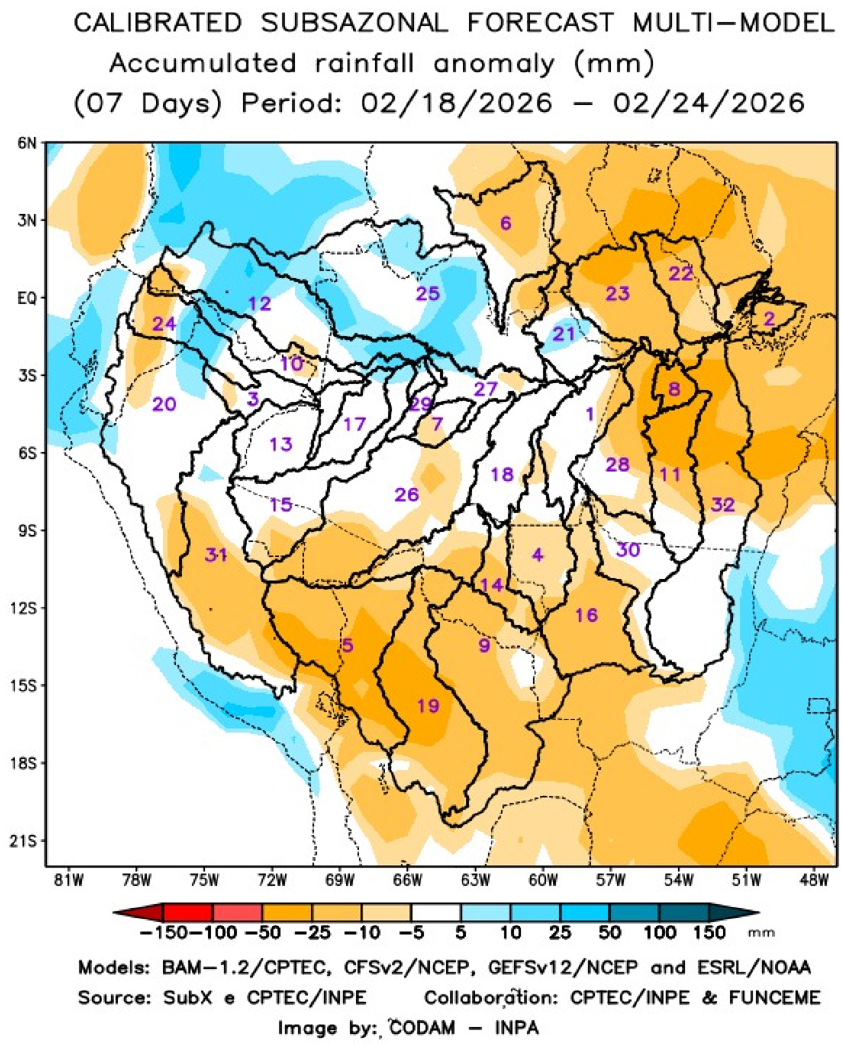




The climatology of the period under analysis indicates rainfall with records varying between ***278 e 304 mm*** sendo being considered normal (reference quantiles 42.5% and 57.5%). On ***February 18, 2026, 250 mm*** of average accumulated precipitation was observed over the basin in 30 days, the calculation of the average of the categorized anomaly index in the basin area the value of ***-1.0,*** classifies the basin as ***dry condition.*** In the coming weeks, climate behavior indicates a ***increase*** in rainfall volumes, the sub-seasonal forecast model suggests ***behavior close to normality or a tending to be dry.***

A multi-model sub-seasonal forecast CPTEC/INPE-FUNCEME produced on 02/17/2026 for the next 7 and 14 days.

The calibrated sub-seasonal multi-model forecast CPTEC/INPE-FUNCEME is generated through scientific cooperation between CPTEC/INPE and FUNCEME, and comes from a set of 4 global models (a Brazilian model, BAM-1.2/CPTEC, and three US models, CFSv2/NCEP, GEFSv12/NCEP and ESRL/NOAA, the latter three from the SubX project). Brazilian model, BAM-1.2/CPTEC, and three US models, CFSv2/NCEP, GEFSv12/NCEP, and ESRL/NOAA, the latter three from the SubX project). The forecast precipitation anomalies are determined in relation to the climatological period from 1999 to 2016. The outputs for the 7 and 14-day forecast intervals are shown below, detailing the forecast behavior of the basins of interest.



1	Abacaxis
2	Amazonas (BR)

32	Xingu

The figure above shows the prognosis for the 14-day interval between 02/18/2026 e 03/03/2026, forecast of a predominance of precipitation deficit (orange) in almost the entire monitored region, over the main course of the Amazon River in Brazilian territory, the basins of the Abacaxis, Aripuanã, Beni, Branco, Coari, Curuá Una, Guaporé, Iriri, Japurá, Ji-Paraná, Juruena, Madeira, Mamoré, Marañon, basins on the left bank of the Amazon River in the northeast of the state of Amazonas and in the northeast and northwest of the state of Pará, Napo, Negro, Purus, Tapajós, Tefé, Ucayali, Xingu, and the main course of the Solimões River. No positive precipitation anomalies (blue) are forecast for the monitored region. Rainfall forecast close to climatology (white) over the main course of the Amazon River in Peruvian territory, the Javari, Juruá, Jutaí, and Teles Pires river basins.

Reference Values for 30-day accumulated precipitation on the date of analysis.

Table 1 shows the average accumulated precipitation values (mm of rain) per basin, based on precipitation estimates using satellite images, a product called MERGE/GPM, made available by the National Institute for Space Research, for the period 2000 - 2022, taking into account the geographical limits of the Amazon basin's watersheds. To this end, the quantile technique was used, as it is a suitable and accurate tool for categorizing precipitation and anomalies of discrete variables. The following thresholds were adopted: 5%, 12.5%, 20%, 27.5%, 35%, 42.5%, 57.5%, 65%, 72.5%, 80%, 87.5%, and 95% in order to stratify the technique and allow for a more detailed categorization of the conditions in each monitored basin.

18/02/2026	Quantiles for categorizing precipitation anomalies											
	5.0%	12.5%	20.0%	27.5%	35.0%	42.5%	57.5%	65.0%	72.5%	80.0%	87.5%	95.0%
Abacaxis	117	159	192	216	235	253	277	295	314	335	365	419

Table 1. Accumulated precipitation quantiles (mm) in 30 days (*20 de January a 18 de February*),

Climatology of the period (2000 - 2025) MERGE/GPM – INPE/CPTEC.

Categorizing rainfall anomalies

Using the values in the table above, it is possible to categorize the rainfall observed in the current year in relation to the values observed in the previous records since the beginning of the available series, so the observed values below the 5% quantile characterize the basin in an extremely dry condition, between 5 and 12.5% in an extremely dry tendency condition, between 12.5 and 20% very dry condition, between 20 and 27.5% very dry tendency, between 27. 5 and 35% dry condition, between 35 and 42.5 dry tendency condition, values between 42.5 and 57.5 define normal condition, values between 57.5 and 65% rainy tendency condition, between 65 and 72.5% rainy condition, between 72.5 and 80% very rainy tendency, between 80 and 87.5 very rainy condition, between 87.5 and 95% indicate extremely rainy tendency and finally values above 95% define the basin in extremely rainy condition, as per the legend below.

QUANTILE	5.0%	12.5%	20.0%	27.5%	35.0%	42.5%		57.5%	65.0%	72.5%	80.0%	87.5%	95.0%
INDEX	-3.0	-2.5	-2.0	-1.5	-1.0	-0.5	0.0	0.5	1.0	1.5	2.0	2.5	3.0
CATEGORY	EXTREMELY DRY	EXTREMELY DRY TENDENCY	VERY DRY	VERY DRY TENDENCY	DRY	DRY TENDENCY	NORMAL	RAINY TENDENCY	RAINY	VERY RAINY TENDENCY	VERY RAINY	EXTREMELY RAINY TENDENCY	EXTRMELY RAINY

The tables below show (Table 2A) the average precipitation observed (mm) in each basin, taking as reference the precipitation estimates by satellite using the MERGE technique, available at http://ftp.cptec.inpe.br/modelos/tempo/MERGE/GPM/DAILY/ accumulated in 30 days on the indicated dates, the average values of the categorized anomalies (Table 2B) were estimated based on the anomaly value of each pixel in the monitored watershed area, calculated according to the methodology described in the previous item, on the same dates of precipitation monitoring, the color scale of the anomalies follows the legend described.
